Hot-spot heating occurs when there is one low current solar cell in a string of at least several high short-circuit current solar cells, as shown in the figure below. One shaded cell in a string reduces the current through the good cells, causing the good cells to produce higher voltages that can often reverse bias the bad cell.

For studying the crack edge chirality and the crack tip structure, two kinds of line cracks, ZZ cracks and AC cracks, are modeled and analyzed. Because of the asymmetry of the lattice structure of WS₂, the ZZ crack is composed of pairs of S atoms at its outermost atomic layer, whereas the other surface is composed of W atoms (see Figure 2c).
