[Matching Rock Layers Lab Answer](#)

The Four Layers. The Earth is composed of four different layers. Many geologists believe that as the Earth cooled the heavier, denser materials sank to the center and the lighter materials rose to the top. Because of this, the crust is made of the lightest materials (rock- basalts and granites) and the core consists of heavy metals (nickel and ...

This is a little trick I picked up in the lab during my PhD. It's the easiest and cheapest way to protect a light-sensitive substance. Light can still get in at the top so if you want you can make your bottle a little foil hat, but I find that it doesn't help over the short period especially if I keep it in the dark.

The answer lies in gemstone geology. Some gems, such as emerald, require extraordinary geologic circumstances to form. Not only do different rock types need to meet under the right conditions and crystallize, certain rare elements often also need to be part of the mixture for the crystal to be the right color.
